This clone is from an A. gambiae BAC library (ND-TAM) provided by
F.H. Collins and sequenced by The Institute for Genomic Research
(TIGR). The BAC library was generated from A. gambiae PEST strain
DNA. All DNA was extracted from newly hatched first instar larvae
to minimize the inclusion of DNA from microaganisms that inhabit
the gut. The DNA is derived from mixed sexes of larvae. The BAC
library was constructed at Texas A&M Universty BAC Center
University, College Station, Texas 77843-2123, USA using a HindIII
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

/note="Organ: Suspensor Region of Globular-Stage Embryos, Vector: TriplEx2; Site_1: SfilA, Site_2: SfilB, Suspensor regions were micro-disgected from globular-stage embryos six days after pollination from greenhouse-grown plants [Weterings et al., Plant Cell 13, 2409-2425 (2001)]. Double-stranded CDNA was synthesized from suspensor mRNA using the SWART CDNA Library Construction Kit according to the manufacturer (Clontech). The suspensor cDNA fragments were directionally ligated into the Sil restriction site of the lambda TriplEx2 vector (Clontech), and the recombinant CDNAs were transformed into E. coli XLI-Blue cells (Clontech). Suspensor cDNA plasmids used for directional sequencing were obtained by in vivo excision from the lambda TriplEx2 recombinants in E. coli BM25.8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         /db xref="taxon:3886"

/note="forgan: Suspensor Region of Globular-Stage Embryos:
/vector: TriplEx2; Site_1: SfilA; Site_2: SfilB; Suspensor regions were micro-dissected from globular-stage embryos six days after pollination from greenhouse-grown plants [weterings et al., Plant Cell 13, 2409-2425 (2001)].
Double-stranded cDNA was synthesized from suspensor mRNA using the SMART cDNA inbrary Construction Rit according to the manufacturer (Clontech). The suspensor cDNA fragments were directionally ligated into the Sfil restriction site
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Estimate 1 (Dases 1 to 309)

## ALI GINMENTS

RESULT 1

BP. ACD28585 standard; DNA; 28

ACD28585;

(first entry) 10-OCT-2003 E. coli ArsR binding oligonucleotide PLASLIB.

ArsR; arsenic resistance operon; biosensor; ss; arsenic.

Escherichia coli.

US2003096275-A1.

22-MAY-2003.

15-AUG-2002; 2002US-00222952.

20-AUG-2001; 2001US-0313714P.

(LAIN/) LAING L G.

Laing LG;

WPI; 2003-576876/54.

New system comprising isolated protein and nucleic acid, and a detection system that indicates a change in binding of the protein to the nucleic acid in the presence of the analyte, useful for detecting the presence of analyte in a sample.

Claim 35; Page 15; 36pp; English.

The invention relates to a new system (biosensor) for detecting the presence of analyte in a sample comprising: (1) an isolated protein that specifically binds the analyte; (2) an isolated nucleic acid containing a specific binding sequence that is bound specifically by the protein; and (3) a detection system that indicates a change in binding of the protein to the nucleic acid in the presence of the analyte. Also included are a biosensor device for detecting the presence of an analyte in a sample, detecting the presence of an analyte in a sample, and the areance resistance operon of E. coli) protein comprising an amino acid sequence that is at least 90% identical to anno acids 1-97 of the ArsR sequence appearing as ABUG3440 binding to a nucleic acid ACD 85.85

The invention relates to a new system (biosensor) for detecting the presence of analyte in a sample comprising: (1) an isolated protein that specifically binds the analyte; (2) an isolated nucleic acid containing a specific binding sequence that is bound specifically by the protein; and (3) a detection system that indicates a change in binding of the protein content in the presence of the analyte. Also included are a biosensor device for detecting the presence of an analyte in a sample, detecting the presence of an analyte in a sample, and an Arsk (encoded by part of the arsenic resistance operon of B. coli) protein comprising an amino acid sequence that is at least 90% identical to amino acids 1-97 of the Arsk sequence appearing as Aug 340 binding to a nucleic acid sequence appearing as Aug 340 binding to a nucleic acid sequence comprising oligonuclectides appearing as ACD 38584-ACD 38591. The system is useful for detecting the presence of analyte in a sample. The present sequence is the top strand of an oligonuclectide which binds to a plantid expressed Arsk protein and is used in the biosensor of the
                                                                                                                                                                                                         ő
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New system comprising isolated protein and nucleic acid, and a detection system that indicates a change in binding of the protein to the nucleic acid in the presence of the analyte, useful for detecting the presence of analyte in a sample.

The invention relates to a new system (biosensor) for detecting the presence of analyte in a sample comprising: (1) an isolated protein that presence of analyte in a sample comprising: (1) an isolated protein that specifically binds the analyte; (2) an isolated nucleic acid containing a specifically binds the analyte; (2) an isolated nucleic acid containing a containing a specific binding sequence that is bound specifically by the protein; and contained are a biosensor device for detecting the presence of the analyte. Also included are a consort of the arsenic resistance operon of E. coli) protein comprising an acid sequence that is at least 90% identical to amino acids 1-97 of the Arsk sequence that is at least 90% identical to amino acids 1-97 of the Arsk sequence appearing as ABG3440 binding to a nucleic acid comprising oligonucleotides appearing as ACD28584-ACD28591. The system is useful for detecting the presence of analyte in a sample. The present sequence is the bottom strand of an oligonucleotide which binds to a plasmid expressed Arsk protein and is used in the biosensor of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

The invention relates to a new system (biosensor) for detecting the presence of analyte in a sample comprising: (1) an isolated protein that specifically binds the analyte; (2) an isolated nucleic acid containing a specifically binds the analyte; (2) an isolated nucleic acid containing a specific binding sequence that is bound specifically by the protein; and (3) a detection system that indicates a change in binding of the protein to the mucleic acid in the presence of the analyte. Also included are a biosensor device for detecting the presence of an analyte in a sample, detecting the presence of an analyte in a sample, and are a carried to the arsenic resistance operon of B. coli) protein comprising an amino acid sequence that is at least 90% identical to amino acids 1-97 of the ArsR sequence appearing as ABU63440 binding to a nucleic acid sequence appearing as ABU63440 binding to a nucleic acid system is useful for detecting the presence of analyte in a sample. The present sequence is the top strand of an oligonuclectide which binds to a plasmid expressed ArsR protein and is used in the biosensor of the Sequence 23 BP; 5 A; 2 C; 4 G; 12 T; 0 U; 0 Other; Claim 35; Page 15; 36pp; English. invention

New nucleic acids or oligomers, useful for diagnosing or treating diseases associated with DNA transcription, e.g. immunological disorders, Wenner syndrome, psoriasis, myocardial infarction, solid tumors or

Claim 1; SEQ ID NO 11; 32pp; English

The invention relates to a nucleic acid, which comprises a segment of the chemically pretreated DNA of genes associated with DNA transcription from one of 346 sequences, and an oligomer that hybridises to or is identical or peptide nucleic acid (PNA)-oligomer that hybridises to or is identical to the chemically pretreated DNA of genes associated with DNA transcription. The set of oligomer probes are useful for detecting the cytosine methylation state and/or single nucleotide polymorphisms (SNPs) in a chemically pretreated genomic DNA. The nucleic acids are useful for diagnosing or treating diseases associated with DNA transcription (particularly with the methylation status), e.g. adenosine deaminase deficiency, viral infection, retroviral infection, Sezary syndrome, the methylation status), e.g. adenosine deaminase deficiency, viral infection, retroviral infection, Sezary syndrome, the methylation status) and sorders, merner syndrome, the methylation associates, syndrome, mycocardial disorders, neurological disorders, provinasis, Rieger's syndrome, cuberculosis, developmental disorders, psychatome, mycocardial infarction, hypertension, angiogenesis, congenital heart disease, HDR syndrome, arthritis, polyglutamine disorders, solid tumours associated genomic DNA molecules of the printed specification but associated genomic DNA molecules of the printed specification but associated in electronic format directly from the European Patent

The present invention describes methods of obtaining immunogenic proteins from Neisseria genomic sequences. AAA81453 to AAA81244 represent specifically claimed Neisseria meningitidis genomic DAA sequences. AAA81260 to AAA81303 and AAB25620 to AAB25663 represent Neisseria DAAA81260 to AAA81303 and AAB25620 to AAB25663 represent Neisseria DAAA81304 to AAA81303 and AAB25620 to AAA81254 to AAA81259 and AAA81304 to AAA81301 represent PCR primers used in the isolation of Neisseria meningitidis DAN sequences; and AAA81322 to AAA81452 represent Neisseria meningitidis DAN sequences; and AAA81322 to AAA81452 represent Neisseria meningitidis DAN sequences; and AAA81322 to AAA81452 represent Neisseria meningitidis DAN sequences; and AAA81322 to AAA81452 represent CC Neisseria protein sequences, and antibodiss against them, can be used in the exemplification of the present invention. The uncleic acid sequences, protein sequences, and antibodiss against them, can be used in the manufacture of a medicament) for treating, concent (or in the manufacture of amedicament) for treating, or preventing or diagnosing infection due to Neisserial bacteria. For example, some of the identification of sequences from the bacterium of pathogenic Neisseriae. Identification of sequences from the bacterium villaso facilitate production of biological probes, particularly or accines have failed mainly due to antigen tolerance. Multivalent corries have also been tried but none have successfully overcome antigenic variability. The provision of further, complete sequences may provide an opportunity to identify secreted or surface exposed proteins that may be presumed targets for the immune system and which are not that may be presumed targets for the immune system and which are antigenically variable or at least more conserved than other more

The present invention describes the full length genome of Neiseeria

meningitidis B (NMB). The sequences in AAP21544 and AAP21607 to AAP21613

crepresent fragments of the NMB genomic sequence, as the sequence was too

long to go in a record on its own it was split into 8 sequences which

coverlap each other at the beginning and end of each sequence by 49980 bp

(i.e. the last 49980 bp of AAP21544 is repeated at the beginning of

AAP21607, the last 49980 bp of AAP21549 are repeated at the beginning of

AAP21607, the last 49980 bp of AAP21589 encode the Neisseria proteins

given in AABS8550 to AABS8593, and AAP21589 to AAP2160 represent FOR

CC primers which are used in the exemplification of the present invention.

The NMB genome and fragments from it have antibacterial activity, and can

compute antibodies which binds to the proteins can be used in compositions

conditions arised to Neisserial bacteria or as a

diagnostic reagent for detecting the presence of Neisserial bacteria or

of antibodies raised to Neisserial bacteria or as a

conduter storage medium or computer databases can be used in a search to

identify open reading frames (ORFS) or coding sequences within the NMB

genome. The DNA sequences provide further opportunities to find antigenic
                                                                                                                                                                                                                                                                                                    Scarlato V;
                                                                                                                                                                                                                                                                                                                                                                                                  Neisseria meningitidis B full length genome sequence and open read:
frames are used to detect, treat and prevent Neisserial infections

Miniature inverted repeat transposable element; MITE; duplication; regulate; IS2; ds.

The present invention relates to a miniature inverted-repeat transposable element (MITE)-like element capable of causing duplication of a target sequence at the site of its insertion in a genomic gene. The invention is useful for causing expression of a transgene in a plant. It can also be used for inducing or regulating the expression in a plant of the gene Novel miniature inverted-repeat transposable element (MITE)-like element useful for constructing transgene expression cassette for stably creating genetically engineered organisms capable of expression of transgene. AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ740 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious a disease as well as other treatment. (I) has cytostatic activity. An oligonucleotide (IV) that hybridises to (SI) can be used for detecting ovarian cancer in a patient's biological sample preferably serum or ovarian tissue. The method comprises contacting a biological
                                                                                                                                                                                                                                                         library using a degenerate probe based on the N-terminal amino acid sequence of the purified enzyme. The amidase is able to hydrolyse amides to carboxylates and has higher activity on ammonium adipamate than on adipamate than on adipamate to diammonium adipate for production of nylon 6,6 or for converting 5-cyanovaleramide to 5-cyanovaleramide to 5-cyanovaleramide to 5-cyanovaleramide to 5-cyanovaleramide to 5-cyanovaleramide to 5-cyanovaleramide (an intermediate for caprolated and intermediate for field.) (Updated on 25-MAR-2003 to correct PN field.) (Updated on 25-MAR-2003 to correct PN field.) (Updated on 25-MAR-2003 to correct PN field.) (Updated on 16-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                          The amidase gene was isolated from a Comamonas testosteroni genomic DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                          New amidase with greater activity on adipamate than on adipamide - a related DNA and microorganisms producing it, partic used to produce ammonium adipate or 5-cyanovalerate for nylon mfr.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Composition for therapy and diagnosis of ovarian cancer comprising polypeptide of a ovarian tumor polypeptide, polynucleotide encoding polypeptide, antibody specific to polypeptide or I cell expressing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ;

                                                                                                                                                                                                                                                                                       sample from a patient with (IV), detecting the amount of polynucleotide hybridising to (IV) and comparing the amount to a predetermined cutoff value and thereby detecting ovarian cancer in the patient, where the amount of polynucleotide hybridising to (IV) is detected preferably by polymerase chain reaction (PCR). (I) comprising (III) and/or (II) is useful for stimulating and/or expanding T cells specific for an ovarian tunnour protein comprising contacting T cells with (III) or (III) is useful in design and preparation of ribozyme molecules for inhibiting to isolate a full length gene from a suitable library e.g., a tumour cells; and library using well known techniques
                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukaemia, Alzheimer's disease, Alz, epilepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Nucleic acid comprising fragment of chemically modified gene, useful for diagnosis and treatment of diseases associated with abnormal cytosine
                                                                                                                                                                                                                                                                                                                           Gaps

AASIS2304 to AAR53970 represent nucleic acids (I) encoding polypeptides (II), given in AAG81454 to AAG83120, from Staphylococcus epidermidis. (I) and lin can have antibacterial activity and therefore can be used in vaccination. The nucleic acids (I) may be used to produce the S. containing the used to produce hosts cells which express the which are used to produce hosts cells which express the college of the polypeptides (II) (and/or nucleic acids) may then be used to vaccinate subjects and to raise antibodies against the bacteria. Comparation of the polypeptides and sisone used to assay for other inhibitors of their cativity and therefore identify compounds that may be used for the treatment of S. epidermidis infections, e.g. endocarditis AAK53971 to treatment of S. epidermidis infections, e.g. endocarditis path53971 to CC AAH55090 represent specifically claimed S. epidermidis genomic DNA CC polymucleotide sequences from the present invention. AAH55091 to AAH55098 corpresent specifically claime all the polymucleotide sequences and primers which are used in the specifically claims all the polymucleotide sequences given in the specifically claims all the polymucleotide sequences given in the specifically only goes up to SEQ ID NO:4454 so even though sequences are given in the disclosure for SEQ ID NO:4455 to 4472, no sequences are given
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                          Nucleic acids encoding polypeptides from Staphylococcus epidermidis, useful for vaccinating against infections, e.g. endocarditis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

Sequence 1995, Application US/09134001C

Patent No. 6380370

GENERAL INFORMATION:

GENERAL INFORMATION:

APPLICATY: Lyan Doucette-Stamm et al

TITLE OF INVENTION: NUCLEIC ACID AND ANINO ACID SEQUENCES RELATING TO STAPHYLOCOCCU:

TITLE OF INVENTION: BPIDERMIDIS FOR DIAGNOSTICS AND THERAPEUTICS

TITLE OF INVENTION: BPIDERMIDIS FOR DIAGNOSTICS AND THERAPEUTICS

CURRENT APPLICATION NUMBER: US/09/134,001C

CURRENT APPLICATION NUMBER: US 60/064,964

PRIOR PILING DATE: 1997-11-08

PRIOR PILING DATE: 1997-08-14

PRIOR PILING DATE: 1997-08-14

NUMBER OF SEQ ID NOS: 5674
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              RESULT 11

New system comprising isolated protein and nucleic acid, and a detection system that indicates a change in binding of the protein to the nucleic acid in the presence of the analyte, useful for detecting the presence of analyte in a sample.

Claim 35; Page 15; 36pp; English

The invention relates to a new system (biosensor) for detecting the presence of analyte in a sample comprising: (1) an isolated protein that specifically binds the analyte; (2) an isolated nucleic acid containing a specifically binds the bound specifically by the protein, and (3) a detection system that indicates a change in binding of the protein to the nucleic acid in the presence of the analyte. Also included are a biosensor device for detecting the presence of an analyte in a sample, detecting the presence of an analyte in a sample, and the areance resistance operno of E. coll) protein comprising an amino acid sequence that is at least 90% identical to amino acids 1-97 of the ArsR sequence appearing as ABU63440 binding to a nucleic acid

```
The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibite proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid, (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid, (4) an antibody capable of specifically binding the polypeptide (5) producing the polypeptide; (5) inhibiting cellular proliferation or the activity of a gene in an operon required for poliferation, (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway the gene product or that has an activity against a biological pathway in equired for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation, or the biological pathway in which a proliferation-required gene or its gene product lies
sequence comprising oligonucleotides appearing as ACD28584-ACD28591. The system is useful for detecting the presence of analyte in a sample. The present sequence is the top strand of an oligonucleotide which binds to a chromosomally expressed ArsR protein and is used in the biosensor of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               screening

or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of strains, or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational culd discovery profiferation in cells other than S. aureus, S. typhimurium, C. Threumoniae or P. aeruginosa. The present sequence is one of the 513 cantisense sequences of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained the constant of the contract of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal
                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                 ftp.wipo.int/pub/published_pct_sequences. useful for generating antibodies against it, detecting or quantitating a bolypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensize, gene mapping, identification of mutations and to produce other types of deta and products dependent on DNA and amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic coding sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPD at fitp.wipo.int/pub/published_pct_sequences
     states involving (II).

New system comprising isolated protein and nucleic acid, and a detection system that indicates a change in binding of the protein to the nucleic acid in the presence of the analyte, useful for detecting the presence of analyte in a sample.

Claim 35; Page 15; 36pp; English

The invention relates to a new system (blosensor) for detecting the presence of analyte in a sample comprising: (1) an isolated protein that specifically binds the analyte; (2) an isolated nucleic acid containing a specific binding sequence that is bound specifically by the protein; and (3) a detection system that indicates a change in binding of the protein to the nucleic acid in the presence of the analyte. Also included are a biosensor device for detecting the presence of an analyte in a sample, detecting the presence of an analyte in a sample, and the arsenic resistance operno of B. coll) protein comprising an amino acid sequence that is at least 90% identical to amino acids 1-97 of the ArsR sequence appearing as ABU63440 binding to a nucleic acid

New system comprising isolated protein and mucleic acid, and a detection system that indicates a change in binding of the protein to the nucleic acid in the presence of the analyte, useful for detecting the presence of analyte in a sample.

Claim 35; Page 15; 36pp; English.

The invention relates to a new system (biosensor) for detecting the presence of analyte in a sample comprising: (1) an isolated protein that specifically binds the analyte; (2) an isolated nucleic acid containing a specific binding sequence that is bound specifically by the protein, and specific binding sequence that is bound specifically by the protein, and containing a specific binding sequence that is bound specifically by the protein and sequence of the analyte. Also included are biosensor device for detecting the presence of an analyte in a sample, and an Arsk (encoded by part of the arsenic resistance operon of E. coli) protein comprising an amino acid sequence that is at least 90% identical to amino acids 1-97 of the Arsk sequence appearing as ABUGA440 binding to a nucleic acid sequence comprising oligonucleotides appearing as ACD28581. The system is useful for detecting the presence of analyte in a sample. The system is useful for detecting the presence of analyte in a sample. The presence is the bottom strand of an oligonucleotide which binds to a chromosomally expressed Arsk protein and is used in the biosensor of the invention

The invention relates to recombinant carcinoma associated (CA) nucleic acid sequences from mouse and human (ADA01482-ADA03094), and to recombinant carcinoma associated proteins (CAP) encoded by them. Them. The invention also encompasses expression vectors and host calls comprising a invention also encompasses expression vectors and host calls comprising to invention also encompasses expression vectors and host calls comprising to binds to the protein, and a blochip comprising CA nucleic acid or fragments thereof. The sequences of the invention were identified using a random. Many of these do not carry transduced host oncogenes or a random. Many of these do not carry transduced host oncogenes or pathogenic retroviruses, which insert into the genome of the host organism at random. Many of these do not carry transduced host oncogenes or pathogenic variant genes, meaning that cancer incidence is a direct consequence of the effects of proviral integration into host carcinoma (especially breast cancer, prostate cancer, lymphoma or the propersion of the sequence of the sequence of the invention of CA gene expression in particular crissues. CA mucleic acids, proteins and antibodies are also useful as thermeuter sequence represents a specifically claimed murine CA nucleic acid sequence of the invention. Note: The complete sequence data for this entering from a properial very from a properial very from a properial very from a protein and evaluation, but was obtained in alertronic forms a specifical as protein and evaluation.

The invention relates to a novel recombinant nucleic acid comprising a nucleotide sequence selected from any of the 660 sequences fully defined in the specification. A polynucleotide of the invention has cytostatic activity, and may have a use in gene therapy, or in a vaccine. The recombinant nucleic acids and polyneptices are useful for treating carcinomas, e.g. lymphomas, cancers, neopleam, adenocarcinoma, and sarcommas. The present sequence represents a mouse gene of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                New recombinant nucleic acid, useful for treating carcinomas, lymphomas, cancers, neoplasm, adenocarcinoma, or sarcomas.

(SAGR-) SAGRES DISCOVERY.

Morris DW, Engelhard EK;

οę New recombinant nucleic acid comprising a nucleotide sequence of any the carcinoma-associated (CA) genes, useful for screening for drug candidates for diagnosing or treating carcinomas.

The invention relates to a recombinant nucleic acid comprising a nucleotide sequence selected from any of the fully defined carcinoma-associated (CA) genes from the 50 tables given in the specification. The CA proteins are secreted, transmembrane or intracellular proteins. The recombinant nucleic acids are useful for screening for drug candidates for diagnosing or treating carcinomas. Sequences given in ADC85215-ADC85514 represent CA genes of the invention.

Novel human polypeptides and polymucleotides useful for diagnosing, preventing and treating cardiovascular disease, neurodegenerative, hyperproliferative disorders and autoimmune disorders.

```
The present investines suppositions build that the specification). ABNIS762 to ABNIS752 encode the human ORFX proteins are useful for in the specification). ABNIS762 to ABNIS752 encode the human ORFX proteins given in ABNIS762 to ABNIS752 encode the human ORFX proteins are useful for treating or preventing a pathology associated with an ORFX-associated disorder in humans, and in the manufacture of a medicament for treating a syndrome associated with ORFX-associated disorder. ORFX polynucleotide sequences can be used in gene therapy. ORFX sequences can be used in the creatment of cancer, hyperproliferative disorders, cirrhosts of liver, psoriasis, benign tumours, Reloid, degenerative disorders related to organ cransis, benign tumours, Reloid, degenerative disorders related to organ cransplantation, cardiovascular disease, disorders, infectious systemic lupus erythematosus, hypertension, hypothyroidism, cholesterol ester storage disease, various immune disorders and disorders, infectious disease, autoimmune thyroiditis, mysthenia gravis, graft-versus-host disease and autoimmune inflammatory eye disease. ORFX proteins are also carthritis, autoimmune inflammatory eye disease. ORFX proteins are also bone degenerative disorders, increasing organic consist.

Conseful for treating burns, incisions, ulcers, for treating osteoporosis, correction or regeneration and treatment of lung or liver fibrosis, reperfusion injury in various tissues and conditions resulting from systemic cytokine damage. NB. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form part of the printed specification, but was obtained in electronic format directly from WIPO at fip.wipo.int/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
              present invention describes substantially purified human proteins Parred to as open reading frame, ORFX, where X is 1-11491 (see Table 1

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical fungs. The invention discloses genomic DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-BB12017). The sequence data for this parent did not form part of the printed specification, but was obtained in electronic format directly from MIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or mare genes from Drosophilar. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB787737). The sequence data for this parent aid not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated nucleic acid detection reagent for detecting 1000 or more
genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              developmental biology; cell signalling; insecticide; cal; gene; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 6872 BP; 2081 A; 1490 C; 1437 G; 1864 T; 0 U; 0 Other;

The present invention relates to nucleic acid sequences (ABQ67188-ABQ7212) from Listeria sp. The sequences are useful as probes and primers for identification and/or detection of Listeria (e.g. as contaminants in foods, or mutational analysis) and for analysis of gene expression. Proteins encoded by the nucleic acid sequences can be used to serien for compounds that modulate gene expression, replication and pathogenicity of Listeria (potential therapeutic agents), also for treating infections by Listeria, and are useful as immunogens in anti-Listeria vaccines. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from MIPO at Etp. wipo.inf/pub/published_pct_sequences. (Updated on 29-AUG-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New genomic sequences from Listeria species, useful for detection, treatment and prevention of infection, also related polypeptides, antibodies and modulators.
                                                                                           Antibacterial; Listeria; food contamination; mutational analysis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Antibacterial, Listeria, food contamination; mutational analysis; infection; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 1773 BP; 624 A; 223 C; 340 G; 537 T; 0 U; 49 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of disciolas, therapeutics and pharmaceutical frugs. The invention disciolase genomic DNA sequences (ABL15176-ABL30511), expressed DNA ABB12012). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from NIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell interactions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

The present invention relates to nucleic acid sequences (ABQ67188-ABQ71212) from Listeria sp. The sequences are useful as probes and primers for identification and/or detection of Listeria (e.g. as contaminants in foods, or mutational analysis) and for analysis of gene expression. Proteins encoded by the nucleic acid sequences can be used to sorien for compounds that modulate gene expression, replication and pathogenicity of Listeria (potential therapeutic agents), also for treating infections by Listeria, and are useful as immunogens in anti-Listeria vaccines. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences. (Updated on 29-AUG-2003 to standardise OS field)
                                                                                                                                                                                                                                                                         New genomic sequences from Listeria species, useful for detection, treatment and prevention of infection, also related polypeptides, antibodies and modulators.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Seguence 8148 BP; 2408 A; 1730 C; 1229 G; 2781 T; 0 U; 0 Other;

Xhol; This cDNA library was constructed from mRNA isolated from immature flowers of field grown plants. The cDNA library was prepared using the Stratagene pBluescript II XR library construction kit. Complementary DNA was synthesized from mRNA using a primer consisting of a poly (dT) sequence with a Xhol restriction site. EcoRl adapters were ligated to the blunt-ended cDNA fragments followed by Xhol digestion. The CDNA fragments were directionally cloned into the EcoRl-Xhol restriction site of the pBluescript vector. The ligated cDNA fragments were transformed into XLIO-Gold host cells. This library was constructed by Dr. Randy Shoemaker and Dr. John Erpelding."

/clone="mhe library Gm-r1070 is a sequence-driven, reracked set 0;9;18 clones selected from cDNA libraries from various tissues and stages of development of soybean that represent 2,639 sequences from immature cotyledons, 1,770 from young pods. The 5' ESTS of the source clones from the different libraries was used to select singletons, or a representative of each contig, which were reracked to a representative of each contig, which were reracked form library Gm-r1070. The cDNA clones of the reracked Gm-r1070 library were then sequenced at the 3' end. The contig analysis to select unique genes was performed by
P1469916. Complementary DNA was synthesized from mRNA using a primer consisting of a poly(dT) sequence with a XhoI restriction site. EcoRI adapters were ligated to the blunt ended cDNA fragments followed by XhoI digestion. The cDNA fragments were directionally cloned into the BCORI-XhoI restriction site of the pBluescript vector. The ligated cDNA fragments were transformed into DH10B host cells (GibcoBRI). This library was constructed in the laboratory of Dr. Randy Shoemaker."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Š
the laboratory of Ernest Retzel, Center for Computational Genomics and Bloinformatics, University of Minnesota, http://www.cbc.umn.edu/ResearchProjects/Scybean/index.html. Reracking was performed by Genome Systems, St. Louis, http://www.genomesystems.com, and 3' sequencing by the Keck Center for Comparative and Runctional Genomics, University of Illinois, the Minchest of Illinois, http://www.life.uiuc.edu/biotech/keck.html. Note: The corresponding 5' EST from each clone in the Gm-11070 library is listed in the 'OTHER BST' field. The detailed information on the source library for each clone can also be obstained by referring to the Genome Systems clone ID of the original cDNA library that is also listed under 'OTHER EST'."

/note="Vector: PWD42nv; Purified genomic DNA from M.
musculus C57BL/6J (male) was obtained from the Jackson
Laboratory Mouse DNA Resource
(http://www.jax.org/resources/documents/dhares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polymucleotide kinase. Adaptor oligonicleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarces gal
electrophoresis. Vector DNA was prepared from a derivative
of pWD42 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. coli Xil0-Gold (Stratagene) cells
and selected for ampicillin resistance."

New system comprising isolated protein and nucleic acid, and a detection system that indicates a change in binding of the protein to the nucleic acid in the presence of the analyte, useful for detecting the presence of analyte in a sample.

Claim 35; Page 15; 36pp; English.

The invention relates to a new system (biosensor) for detecting the presence of analyte in a sample comprising: (1) an isolated protein that specifically binds the analyte; (2) an isolated nucleic acid containing a specific binding sequence that is bound specifically by the protein; and (3) a detection system that indicates a change in binding of the protein to the nucleic acid in the presence of the analyte. Also included are a biosensor device for detecting the presence of an analyte in a sample, detecting the presence of an analyte in a sample, detecting the presence of an analyte in a sample, and the areanic resistance operan of E. coil) protein comprising an amino acid sequence that is at least 90% identical to amino acids 1-97 of the ArsR sequence appearing as ABU63440 binding to a nucleic acid

sequence comprising oligonucleotides appearing as ACD28584-ACD28591. The system is useful for detecting the presence of analyte in a sample. The present sequence is the bottom strand of an oligonucleotide which binds to a chromosomally expressed Arsk protein and is used in the biosensor of the invention

the 6113 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation, (7) identifying a gene in an operon required for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for rellular proliferation or the between compound that inhibits solidication of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the correction of an organism. The antisense nucleic acids required for cellular proliferation to isolate molecules for rational drug discovery programs, or for screening homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational The invention relates to an isolated nucleic acid comprising any one of

required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is one of the 6213 antisense sequences of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published\_pct\_sequences. New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity.

Claim 1; SEQ ID NO 18359; 103pp; English.

The invention relates to isolated polynucleotide (1) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed sequence tags for identifying expressed sequence tags for identifying expressed contains the polynucleotides are also used in dissue, as molecular weight markers and as a food supplement. (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its bhinding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders in polypeptide and polynucleotide sequences have applications in displance in the produce other types of data and products dependent on DNA and to produce other types of data and products dependent on DNA and

amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic coding sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published\_pct\_sequences ន្តដូចមន្តន

New system comprising isolated protein and nucleic acid, and a detection system that indicates a change in binding of the protein to the nucleic acid in the presence of the analyte, useful for detecting the presence of analyte in a sample.

Claim 35; Page 15; 36pp; English.

The invention relates to a new system (biosensor) for detecting the presence of analyte in a sample comprising: (1) an isolated protein that presence of analyte in a sample comprising: (1) an isolated protein that specifically binds the analyte; (2) an isolated mucleic acid containing a specifically binds the analyte; (2) an isolated mucleic acid containing a containing a specific binding sequence that is bound specifically by the protein; and contained are a biosensor device for detecting the presence of the analyte. Also included are a biosensor device for detecting the presence of an analyte in a sample, detecting the presence of an analyte in a sample, and an Arsk (encoded by part of the arsenic resistance operon of B. coli) protein comprising an caid sequence that is at least 9% identical to anino acids 1-97 of the Arsk sequence appearing as ABUG3440 binding to a nucleic acid sequence comprising oligonucleotides appearing as ACD28584-ACD28591. The system is useful for detecting the presence of analyte in a sample. The present sequence is the bottom strand of an oligonucleotide which binds to a chromosomally expressed Arsk protein and is used in the biosensor of the invention

The present invention describes substantially purified human proteins (referred to as open reading frame, ORFX, where X is 1-11491 (see Table 1 in the specification). ARNITS62 to ARNITS52 encode the human ORFX proteins given in ABPOUND to ABPIS00. ORFX proteins are useful for treating or preventing a pathology associated with a manufacture of a medicament for treating a syndrome associated with ORFX-associated disorder: ORFX polymorleotide squences can be used in gene therapy. ORFX sequences can be used in the treatment of cancer, hyperproliferative disorders, cirrhosis of liver. Described to a manufacture of a medicament for treating a sequences can be used in the treatment of cancer, hyperproliferative disorders, cirrhosis of liver. Described to mineral disorders disorders related to organ transplantariton, cardiovascular diseases, disorders related to organ transplantariton, cardiovascular diseases, disorders related to organ transplantariton, cardiovascular diseases, disorders related to organ structure disorders such as multiple sclerosis, infectious diseases, autoimmune inflammatory eve disease. ORFX proteins are also disease and autoimmune inflammatory eve disease. ORFX proteins are also cueful for treating burns, incisions, ulcers, for treating osteoporosis, bone degenerative disorders, or leriodontal disease. And for gut protection or regeneration and treatment of lung or liver fibrosis, premic cycokine damage. NB. The sequence data for this patent did not systemic cycokine damage. NB. The sequence data for this patent did not formant disease and conditions resulting in each of the printed specification, but were observed to each of the printed specification, but were observed to each of the printed specification, in the sequence data for the printed specification, in the sequence of the printed specification in the sequence of the printed specification in the sequen form part of the printed specification, but was obtained in electronion format directly from WIPO at ftp.wipo.int/pub/published\_pct\_sequences

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidaring cell signalling and cell-cell interactions in bigher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL1617-5 and the encoded proteins (ABB7737-Sequences (ABL16175) and the encoded proteins (ABB7737-ABB77072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Drosophila melanogaster expressed polynucleotide SEQ ID NO 29930.
                                                                                                                                                                                                                                                                                                                                               Drosophila, developmental biology, cell signalling; insecticide, pharmaceutical; gene; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Drosophila; developmental biology; cell signalling; insecticide;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 6872 BP; 2081 A; 1490 C; 1437 G; 1864 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or mare genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insectioides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL3611), expressed DNA sequences (ABL018176-ABL3611), expressed DNA SHB77072). The sequence data for this patent did not form part of the princed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                  New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Drosophila melanogaster expressed polynucleotide SEQ ID NO 11852
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Drosophila, developmental biology; cell signalling, insecticide,

                                                                                                                                  The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABI16176-ABI30511), expressed DNA sequences (ABI16176-ABI30511), expressed DNA ABB72072). The sequence data for this patent did not form part of printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell interactions.
                                                             detection reagent for detecting 1000 or more for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Drosophila melanogaster expressed polynucleotide SEQ ID NO 11858.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Drosophila; developmental biology; cell signalling; insecticide; pharmaceutical; gene; ss.

The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid retukaemia, Alzheimer Walsease, Alzheimer Walsease, Alzheimer Walsease, Parls, epilepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention

cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABILG176-ABILG1911), expressed DNA agequences (ABILG196-ABILG1911), expressed DNA ABB72072). The sequence data for this patent did not form part of printed specification, but was obtained in electronic format direct from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 19082 BP; 5097 A; 429 C; 4336 G; 9220 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from NIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukaemia, Alzheimer's disease, All'Ds, epilepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention
